The document was opened only to be read, not to be changed. Every paragraph in this sample is plain English so the translation layer has something predictable to work with. The reader should merge lines into paragraphs conservatively, and it should never join two columns into one sentence.

A second paragraph begins here. It exists to test paragraph detection: lines are close together, the gap between paragraphs is larger, and there is no indentation on the first line.

Footnotes and page numbers are the usual sources of noise in PDF text extraction. This sample has a page number at the bottom.
